

Sentinel — Model 3 Federated Correlation Report

Generated 2026-09-11T11:22:50.288762Z

Three source systems are federated here, and they are honest in different ways. System A ('sentinel') is Sentinel's own real Model 1/2 stack. System B ('nyc_open_data') is a real, independent, public dataset (NYC Open Data's 'Open Parking and Camera Violations') used to demonstrate genuine cross-system format normalization — it is NOT a second Gujarat departmental VMS, and it has zero real plate overlap with the Sentinel sandbox by construction (different countries), so it correlates with nothing. System C ('demo_partner_vms') is SYNTHETIC: every one of its rows was hand-written, replaying plates Sentinel really did read as if a partner system had also seen them. It exists so the correlation engine can be exercised end-to-end rather than only by unit tests. Correlations below therefore prove that the adapter and correlation pipeline work; they do NOT prove that any vehicle was really observed by two agencies.

Metric	Value
Correlation window (s)	300.0
Total federated events	1105
Source systems present	demo_partner_vms, nyc_open_data, sentinel
Correlated plates found	4

Correlated plates

Plate	Sources	Time gap (s)	Confidence	Basis
GJ01KH0099	demo_partner_vms + sentinel	47	0.86	SYNTHETIC
GJ09BA7548	demo_partner_vms + sentinel	128	0.70	SYNTHETIC
GJ32B2040	demo_partner_vms + sentinel	212	0.59	SYNTHETIC
GJ27ED1763	demo_partner_vms + sentinel	284	0.51	SYNTHETIC
